Remarks
Translations of the European Technical Assessment in other languages shall fully correspond to the original issued document and should be identified as such.

Communication of the European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may be made with the written consent of Österreichisches Institut für Bautechnik. Any partial reproduction has to be identified as such.

Specific parts

1 Technical description of the product

1.1 General

The European Technical Assessment\(^1\) – ETA – applies to a kit, the unbonded PT system

**DYWIDAG single monostrand anchorage,**

comprising the following components.

- Tendon
  Unbonded tendon with one single monostrand as tensile element

- Tensile element
  7-wire prestressing steel strand with nominal diameters and nominal tensile strengths as given in Table 1, factory provided with a corrosion protection system, comprising corrosion protective filling material and PE-sheathing.

\(^{\text{NOTE}}\) 1 N/mm\(^2\) = 1 MPa

- Anchorage
  Monostrand anchored by 3-piece wedge
  Stressing (active) and fixed (passive) anchor with wedge and anchor body 1072 for tendons with one single monostrand

---

\(^1\) ETA-13/0814 was firstly issued in 2013 as European technical approval with validity from 25.06.2013 and converted 2018 to European Technical Assessment ETA-13/0814 of 15.06.2018.

\(^2\) Standards and other documents referred to in the European Technical Assessment are listed in Annex 9.

OIB-205-118/17-019
- Additional reinforcement in the anchorage zone
- Transition tube between anchor body 1072 and monostrand
- Permanent corrosion protection for tensile elements and anchorages

PT system

1.2 Designation and range of anchorages

1.2.1 Designation

The anchorage is designated by its function in the structure, the nominal diameter of the prestressing steel strand and the number of prestressing steel strands, i.e. one single prestressing steel strand. The first number indicates the nominal diameter of the prestressing steel strand, “78” = 15.3 mm (0.6”) or 15.7 mm (0.62”), followed by the maximum number of prestressing steel strands per unit “n”, 78 n, i.e. 7801 for the DYWIDAG single monostrand anchorage.

1.2.2 Range

The PT system provides tendons with one single monostrand. The characteristic values of maximum force, \( F_{pk} \), of the tendon are given in Annex 4.

1.2.3 Stressing anchor

The stressing anchor comprises the 1-piece anchor body 1072 with a circular disc for load transfer, one 3-piece wedge, a transition tube, and a grease cap, see Annex 1 and Annex 2. Anchor body 1072 serves for both in one piece, anchoring the prestressing steel strand and load transfer to the structural concrete. The additional reinforcement, see Annex 3, is placed and secured exactly centrically with regard to the anchor body 1072.

The transition tube is attached to the anchor body 1072. The monostrand is threaded into the anchor body 1072 through the transition tube, ensuring an overlap between monostrand sheathing and transition tube. Following stressing, the monostrand is anchored in anchor body 1072 by means of the wedge.

1.2.4 Fixed anchor

The fixed anchor comprises the same components as the stressing anchor.

The fixed anchor can either be assembled on the construction site like a stressing anchor or preassembled with the monostrand in the factory. For preassembled fixed anchor the monostrand is cut, observing the required length, and de-sheathed along a section suitable for anchor body 1072. The de-sheathed monostrand is threaded into the anchor body 1072 through the transition tube. An overlap between monostrand sheathing and transition tube is ensured. The wedge is inserted, the anchor body 1072 is filled with corrosion protective filling material, and the grease cap is attached.

In Annex 2 the stressing and fixed anchor is shown. Preassembled anchorages do not require access during stressing and can be embedded in concrete, observing a cover of concrete on the grease cap of at least 20 mm.

1.2.5 Centre and edge distances, concrete cover

The minimum centre and edge distances of tendon anchorages and the actual mean compressive strength of concrete at time of stressing \( f_{cm,0} \), as given in Annex 3, are adopted. However, the centre and edge distances of anchorages may be reduced in one direction by up to 15 %, but are not smaller than the outer diameter of the anchor body 1072 and placing of additional reinforcement is still possible. In case of a reduction of the distances in one direction, the centre and edge distances in the perpendicular direction are increased by the same percentage, in order to keep the same concrete area in the anchorage zone.
The concrete cover of the tendon is under no circumstances less than 20 mm nor less than the concrete cover of the reinforcement installed in the same cross section. The anchorage has a concrete cover of at least 20 mm on the grease cap. Standards and regulations on concrete cover in force in the place of use are observed.

1.2.6 Strength of concrete

Concrete according to EN 206 is used.

At the time of transmission of full prestressing force to the structural concrete, the actual mean cube compressive strength of concrete, \( f_{cm,0,cube} \), or the actual mean cylinder compressive strength of concrete, \( f_{cm,0,cyl} \), is at least as given in Annex 3. The actual mean compressive strength, \( f_{cm,0,cube} \) or \( f_{cm,0,cyl} \), is verified by means of at least three specimens, cube of size 150 mm or cylinder with diameter of 150 mm and height of 300 mm, which are cured under the same conditions as the structure.

For partial prestressing with 30% of the full prestressing force, the actual mean concrete compressive strength is at least \( 0.5 \cdot f_{cm,0,cube} \) or \( 0.5 \cdot f_{cm,0,cyl} \). Intermediate values may be interpolated linearly according to Eurocode 2.

1.2.7 Reinforcement in the anchorage zone

Steel grade and dimensions of additional reinforcement specified in the Annex 3 are conformed to. The centric position of the additional reinforcement is secured by appropriate means.

If required for a specific project design, the reinforcement given in Annex 3 may be modified in accordance with the respective regulations in force at the place of use as well as with the relevant approval of the local authority and of the ETA holder to provide equivalent performance.

1.3 Tendon – Designation and range

The tendon is designated by the nominal diameter of the prestressing steel strand and the number of prestressing steel strands with 78n. The first number indicates the nominal diameter of the prestressing steel strand “78” = 15.3 mm (0.6”) or 15.7 mm (0.62”), followed by the number "n" of prestressing steel strands, i.e. 7801 for the DYWIDAG single monostrand anchorage.

The PT system provides tendons with one single monostrand. Only 7-wire prestressing steel strands with nominal diameters of 15.3 mm or 15.7 mm and nominal tensile strengths of 1 770 N/mm² or 1 860 N/mm² are used. The dimensions and specifications of the prestressing steel strands are given in Table 1 and Annex 4.

Characteristic values of maximum force, \( F_{pk} \), of the tendon are given in Annex 4.

1.4 Maximum stressing forces

Prestressing and over stressing forces are specified in the respective standards and regulations in force at the place of use. Annex 4 lists the maximum prestressing and over stressing forces of the tendons according to Eurocode 2, i.e. the maximum prestressing force applied to a tendon does not exceed \( P_{max} = 0.90 \cdot A_p \cdot f_{p0.1} \). Overstressing with \( P_{max,o} = 0.95 \cdot A_p \cdot f_{p0.1} \) is only permitted if the force in the jack can be measured to an accuracy of \( \pm 5 \% \) of the final value of the over stressing force.

Initial prestressing force, \( P_{m0} \), immediately after stressing and anchoring does not exceed the forces as specified in Eurocode 2.

Where

\[
A_p \dots \dots \text{Cross-sectional area of prestressing steel, i.e. } A_p = n \cdot S_n \\
f_{p0.1} \dots \text{Characteristic 0.1% proof stress of prestressing steel, i.e. } F_{p0.1} = f_{p0.1} \cdot S_n \\
n \dots \text{Number of prestressing steel strands, i.e. } n = 1 \\
S_n \dots \text{Nominal cross-sectional area of one single prestressing steel strand, see Annex 4}
\]
F_{p0.1} \ldots \ldots \ldots \text{kN} \ldots \ldots \ldots \text{Characteristic value of 0.1 % proof force, see Annex 4}

P_{m0} \ldots \ldots \ldots \text{kN} \ldots \ldots \ldots \text{Initial prestressing force immediately after stressing and anchoring}

1.5 Slip at anchorages

Slip at anchorages is taken into consideration in design and for determining tendon elongation. In Table 2 slip taken into account for determination of elongation during stressing and of prestressing force and the required locking measures of the wedge are specified. While the slip at the fixed end only is considered for calculation of elongation, the slip at the stressing end mainly occurs at the load transfer from jack to anchorage and is considered for calculation of the prestressing force.

<table>
<thead>
<tr>
<th>Anchorage</th>
<th>Slip</th>

</tr>
<tr>
<td>Slip at stressing anchor 1)</td>
<td>6 2)</td>
<td>—</td>
</tr>
<tr>
<td>Slip at fixed anchor</td>
<td>6</td>
<td>Grease cap</td>
</tr>
</tbody>
</table>

1) Slip at transfer of prestressing force from jack to anchorage.
2) Slip is 3 mm with power-seating of \( \sim 20 \text{ kN} \) per prestressing steel strand. This requires a special jack, its availability requires coordination with the ETA holder.

1.6 Friction losses

The tendon layout should not feature abrupt changes of the tendon axis, since this may lead to significant additional friction losses. Due to the corrosion protective filling material within the PE-sheathing of monostrands, the friction coefficient \( \mu \) is very low. For calculation of losses of prestressing forces due to friction, Coulomb's friction law applies. Calculation of friction loss is by the equation

\[
P_x = P_0 \cdot \left( 1 - e^{-\mu \cdot (\alpha + k \cdot x)} \right)
\]

Where

- \( P_x \ldots \ldots \ldots \text{kN} \ldots \ldots \ldots \text{Prestressing force at distance x from the stressing anchor along the tendon} \)
- \( P_0 \ldots \ldots \ldots \text{kN} \ldots \ldots \ldots \text{Prestressing force at the distance x = 0 m} \)
- \( \mu \ldots \ldots \ldots \text{rad}^{-1} \ldots \ldots \ldots \text{Friction coefficient, } \mu = 0.06 \text{ rad}^{-1} \)
- \( \alpha \ldots \ldots \ldots \text{rad} \ldots \ldots \ldots \text{Sum of angular deviations over a distance x, irrespective of direction and sign} \)
- \( k \ldots \ldots \ldots \text{rad/m} \ldots \ldots \ldots \text{Wobble coefficient, } k = 0.9 \cdot 10^{-2} \text{ rad/m} (= 0.5 \text{ °/m}) \)
- \( x \ldots \ldots \ldots \text{m} \ldots \ldots \ldots \text{Distance along the tendon from the point where the prestressing force is equal to } P_0 \)

NOTE 1 rad = 1 m/m = 1

Friction losses in the anchorages are low and are not taken into consideration in design and execution.
1.7 Support of monostrands

Monostrands are installed with high accuracy and secured in their position. Spacing of tendon support is.

1 Normally ............................................................................................................................................. ≤ 1.00 m

For radius of curvature in normal cases, see Clause 1.8.

2 Free tendon layout, see Annex 6, in maximum 45 cm thick slabs

In the transition zone between

a) high tendon position and anchorage, e.g. cantilever.......................................................... 1.50 m

b) low and high tendon position or low tendon position and anchorage ............................. 3.00 m

At high and low tendon position, the tendons are connected in an appropriate way to the rebar mesh, at least at two points with a spacing of 0.3 m to 1.0 m. The rebar mesh is fastened in its position. Special spacers for tendons are therefore not required. For details see Annex 6.

1.8 Radii of curvature

The minimum allowable radius of curvature for internal tendons with prestressing steel strands of nominal diameters of 15.3 mm and 15.7 mm is 2.5 m. If this radius is adhered to, verification of prestressing steel outer fibre stresses in curvatures is not required. The minimum radius of curvature in the anchorage zone outside the transition tube is 3.5 m.

Components

1.9 Monostrand

1.9.1 Specification of prestressing steel strand

7-wire prestressing steel strands with plain surfaces of the individual wires, nominal diameters of 15.3 mm or 15.7 mm, and tensile strengths of 1 770 N/mm² or 1 860 N/mm² are used. Dimensions and specifications of the prestressing steel strands are according to prEN 10138-3 and are given in Clause 1.1, Table 1, and Annex 4.

1.9.2 Specification of monostrand

The tendon for DYWIDAG single monostrand anchorage comprises one single monostrand with a 7-wire prestressing steel strand according to Clause 1.9.1, factory provided with a corrosion protection system comprising a corrosion protective filling material and a PE-sheathing, see Clause 1.11.

Within one structure, prestressing steel strands with one nominal diameter and one characteristic tensile strength should be used. If tendons with prestressing steel strands different in diameter and tensile strength are to be installed, appropriate measures to prevent confusion are implemented.

In the course of preparing the European Technical Assessment, no characteristic has been assessed for the monostrand. In execution, a suitable monostrand that conforms to Annex 4 and is according to the standards and regulations in force at the place of use is taken.

1) Designation according to prEN 10138-3
2) Corresponding to 0.6 inches
3) Corresponding to 0.62 inches
4) For strands according to prEN 10138-3, 09.2000, the values are multiplied by 0.98.

1.10  Anchorage components

1.10.1  General

Specification of anchorage components are given in the Annexes and the technical file3 of the European Technical Assessment. Therein the components’ dimensions, materials, material identification data with tolerances and the materials used in corrosion protection are specified.

For prestressing steel strands with nominal diameters of 15.3 mm and 15.7 mm and with nominal tensile strengths of 1 860 MPa and 1 770 MPa the same anchorages are used.

1.10.2  Anchor body 1072

The anchor body 1072 is forged of steel with a circular disc as load transfer plane and a bore for anchoring the prestressing steel strand, see Annex 1. The bore provides a conical end at one side for bearing the wedge. Anchor body 1072 is employed for stressing and fixed anchors.

For installation the bores and cones are clean and free of damage or rust and are provided with corrosion protection oil.

1.10.3  Transition tube

The transition tube is a precision steel tube, which is connected to the anchor body 1072 by cold forming. It secures the transition from monostrand to anchorage, see Annex 2.

1.10.4  Wedges

Only 3-piece wedges according to Annex 1 are used. The wedges feature different lengths for the respective nominal diameters of the prestressing steel strand. Wedge dimensions and teeth geometry are specified with reference to nominal strand diameter, 15.3 mm or 15.7 mm, in Annex 1.

1.10.5  Additional reinforcement

The steel grades and dimensions of the additional reinforcement are in conformity with the specifications given in Annex 3.

---

3 The technical file of the European Technical Assessment is deposited at Österreichisches Institut für Bautechnik.
1.10.6 Grease cap

The grease cap is made of plastic and seals the tendon ends at the anchorages.

The grease cap on the not accessible fixed anchor prevents the wedge being displaced before stressing, see Annex 2. After stressing it seals the anchorage and contains corrosion protective filling material.

1.11 Permanent corrosion protection

In the course of preparing the European Technical Assessment no characteristic has been assessed for components and materials of the corrosion protection system. In execution, all components or materials are selected according to the standards and regulations in force at the place of use.

The prestressing steel strand is provided in the factory with corrosion protection, comprising corrosion protective filling material and PE-sheathing. Corrosion protection at the anchorage is provided by corrosion protective filling material and the anchor body 1072, together with the transition tube overlapping the monostrands, and the grease cap.

Application of corrosion protection in the anchorage zone conforms to the assembly instructions specified in the Clauses 2.2.4.3.3, and 2.2.5.1. The de-sheathed monostrand is covered completely by the transition tube. At final stage, the monostrand section with PE-sheathing overlaps the transition tube by at least 80 mm. The transition joint is sealed and the void in the anchorage zone is completely filled with a corrosion protective filling material.

1.12 Material specifications of the components

Material specifications of the components are given in Annex 5.

2 Specification of the intended use in accordance with the applicable European Assessment Document (hereinafter EAD)

2.1 Intended use

The PT system DYWIDAG single monostrand anchorage is intended to be used for the prestressing of structures. The use category according to tendon configuration and material of structure is

- Internal unbonded tendon for concrete and composite structures

2.2 Assumptions

2.2.1 General

Concerning product packaging, transport, storage, maintenance, replacement, and repair it is the responsibility of the manufacturer to undertake the appropriate measures and to advise his clients on transport, storage, maintenance, replacement, and repair of the product, as he considers necessary.

2.2.2 Packaging, transport and storage

Tendons and anchorages may be assembled on site or at the factory, i.e. pre-assembled tendons. During transport, the tendons may be wound to a coil with a minimum internal diameter of 1.5 m or as specified by the manufacturer of the monostrand.

Advice on packaging, transport, and storage includes

- Temporary protection of prestressing steels and components in order to prevent corrosion during transportation from the production site to the job site.

- Transportation, storage, and handling of prestressing steel and other components in a manner as to avoid damage by mechanical or chemical impact.
- Protection of tensile elements and other components from moisture.
- Keeping tensile elements away from zones where welding operations are performed.

2.2.3 Design

Advice on design includes:

- Design of the structure permits correct installation and stressing of tendon and design and reinforcement of the anchorage zone permits correct placing and compacting of concrete.
- Verification of transfer of stressing forces to the structural concrete is not required if the centre and edge distances of the tendons, strength of concrete, as well as grade and dimensions of the additional reinforcement, see Clause 1.2.7 and Annex 3, are conformed to. Additional reinforcement is of closed stirrups or properly anchored orthogonal reinforcement. The forces outside the area of the additional reinforcement are verified and, if necessary, covered by appropriate, in general transverse reinforcement. The reinforcement of the structure is not employed as additional reinforcement. Reinforcement exceeding the required reinforcement of the structure may be used as additional reinforcement if appropriate placing is possible.
- The anchorage recess is designed as to ensure a concrete cover of at least 20 mm at the caps in the final state.
- Bursting out of prestressing steels in case of failure is prevented. Sufficient protection is provided by e.g. a cover of reinforced concrete.
- The initial prestressing force applied to the stressing anchor will decrease especially as a result of slip, see Clause 1.5, friction along the tendon, see Clause 1.6, and of the elastic shortening of the structure, and in the course of time because of relaxation of the prestressing steel, and creep and shrinkage of concrete. The stressing instructions prepared by the ETA holder should be consulted.

2.2.4 Installation

2.2.4.1 General

It is assumed that the product will be installed according to the manufacturer’s instructions or – in absence of such instructions – according to the usual practice of the building professionals.

Assembly and installation of tendons are only carried out by qualified PT specialist companies with the required resources and experience in the use of the unbonded prestressing system DYWIDAG single monostrand anchorage, see CWA 14646. The company’s PT site manager has a certificate, stating that she or he has been trained by the ETA holder and that she or he possesses the necessary qualification and experience with the unbonded prestressing system DYWIDAG single monostrand anchorage.

2.2.4.2 De-sheathing of monostrands

The length along which the monostrand sheathing is removed is determined by the PT specialist company depending on the expected variations in temperature between installation and concreting. The monostrand sheathing overlaps the transition tube but does not press against the anchorage. This is checked by the application of markings before concreting.

2.2.4.3 Anchor body 1072

2.2.4.3.1 General

Anchor body 1072 is a 1-piece anchor body with a transition tube jointed by cold forming. The anchorage is applied as stressing anchor, as accessible fixed anchor, and as inaccessible fixed anchor. For an inaccessible fixed anchor the grease cap secures the wedge seating. At final stage the voids in anchorage and transition tube are completely filled with corrosion protective filling material. The monostrand sheathing overlaps the transition tube by at least
80 mm and does not press against the anchorage. This is checked by application of markings before concreting.

The centric position of the additional reinforcement is secured by tying or by means of spacers braced against the tendon.

Anchor body 1072 is installed perpendicular to the tendon’s axis. Adjacent to the transition tube the tendon continues with a straight section over a length of at least 125 mm.

2.2.4.3.2 Stressing anchor

The anchor body 1072 is fastened to the formwork on site and connected to the monostrand. Site assembly comprises the following steps.

- Fastening the anchor body 1072 with assembled transition tube and with pocket element and retaining spindle pushed through the hole in the formwork.
- Placing the monostrand against the anchorage to mark the cutting point and overlapping length on the PE-sheathing.
- Cutting and pulling off the PE-sheathing of the monostrand in the anchorage zone.
- Inserting the monostrand through transition tube and anchor body 1072.
- Check of overlapping length between PE-sheathing and transition tube, filling of transition tube with corrosion protective filling material and sealing of respective transition joint.
- Placing the previously removed PE-sheathing onto the end of the prestressing strand in order to protect the prestressing steel strand protrusion.

For prefabricated tendons the first step is done later on site. The other steps are carried out in identical order and the prefabricated tendon is prepared, e.g. coiled, for transport.

2.2.4.3.3 Fixed anchor

The fixed anchors are also either prefabricated or assembled and installed at the construction site. In case of inaccessible fixed anchors, it additionally comprises the mounting of grease cap before or at tendon installation for securing the wedge.

The fixed anchor usually is assembled in the factory. Factory assembly comprises the following steps.

- Placing the wedge into the conical bore of the anchor body 1072.
- Filling in a measured quantity of corrosion protective filling material.
- Screwing on the grease cap filled with corrosion protective filling material.
- Removing a 5 to 6 cm long piece of the PE-sheathing from the monostrand.
- Inserting the de-sheathed monostrand through the transition tube, observing the overlapping length.
- Wiping off the corrosion protective filling material that has leaked from the transition tube and sealing the joint monostrand to transition tube.
- Cutting the monostrand from the coil, ensuring the correct length.

2.2.4 Examination of tendons and possible repairs of the corrosion protection system

During installation careful handling of tendons is ensured. Before concreting the PT site manager carries out a final examination of the installed tendons. Damages to PE-sheathings, which cause or may cause leaking of corrosion protective filling material, are repaired. Repair is in accordance with the respective load requirements and suitable for operating temperatures up to 30 °C.
2.2.5 Stressing and stressing records

2.2.5.1 Stressing

With a mean concrete compressive strength in the anchorage zone, $f_{cm,0}$, according to the specifications in Annex 3, full prestressing may be applied.

The prestressing forces are applied in accordance with a prescribed stressing schedule. Said schedule includes

- Mean cube or cylinder compressive strength of the concrete at time of stressing
- Time and sequence of the various prestressing levels
- Prestressing forces and elongations calculated for the tendons
- Time and kind of shuttering lowering and removal
- Any possible spring back forces of the falsework are taken into account.

Prestressing comprises the following steps.

- Removing the PE protective sheathing from the prestressing steel strand protrusion.
- Filling the void in the anchorage with corrosion protective filling material using a thin injection lance.
- Placing the wedge into the conical bore of the stressing anchor.
- Stressing with prestressing jack.
- Cutting off the prestressing steel strand protrusion with a cutting disk or cutting tool.
- Screwing on the grease cap filled with corrosion protective filling material.
- Filling the anchorage recess with concrete.

2.2.5.2 Restressing

Restressing of tendons before final cutting of prestressing steel strand protrusions in combination with release and reuse of the wedge is permitted. After restressing, the wedge bites into a least 15 mm of virgin prestressing steel strand surface and no wedge marks remain on the tendon between the anchorages.

2.2.5.3 Stressing records

Any important observations made during stressing operation, in particular prestressing forces applied and elongation measures, are recorded in a stressing record for each tendon.

2.2.5.4 Stressing equipment, clearance requirements, and safety-at-work

For stressing, hydraulic jacks are used. Information about the stressing equipment has been submitted to Österreichisches Institut für Bautechnik. Special jack with power-seating mechanism for reduced slip at the stressing anchor requires coordination with the ETA holder for timely availability.

To stress the tendons, clearance of approximately 1 m directly behind the anchorage is ensured. The ETA holder keeps available more detailed information on the jacks used and the required space for handling and stressing.

The safety-at-work and health protection regulations shall be complied with.

2.2.6 Welding at anchorages

Welding is not intended and it is not permitted to weld on built-in components of the PT systems.

In case of welding operations near tendons, precautionary measures are required to avoid damage to the corrosion protection system.
2.3 Assumed working life

The European Technical Assessment is based on an assumed working life of DYWIDAG single monostrand anchorage of 100 years, provided that DYWIDAG single monostrand anchorage is subject to appropriate installation, use, and maintenance, see Clause 2.2.

In normal use conditions, the real working life may be considerably longer without major degradation affecting the basic requirements for construction works.4

The indications given as to the working life of the construction product cannot be interpreted as a guarantee, neither given by the product manufacturer or his representative nor by EOTA nor by the Technical Assessment Body, but are regarded only as a means for expressing the expected economically reasonable working life of the product.

3 Performance of the product and references to the methods used for its assessment

3.1 Essential characteristics

The performances of DYWIDAG single monostrand anchorage for the essential characteristics are given in Table 4.

Table 4 Essential characteristics and performances of the product

4 The real working life of a product incorporated in a specific works depends on the environmental conditions to which that works are subject, as well as on the particular conditions of design, execution, use, and maintenance of that works. Therefore, it cannot be excluded that in certain cases the real working life of the product may also be shorter than the assumed working life.
### Product performance

#### 3.2.1 Mechanical resistance and stability

#### 3.2.1.1 Resistance to static load

The PT system as described in the ETA meets the acceptance criteria of EAD 160004-00-0301, Clause 2.2.1. The characteristic values of maximum force, $F_{pk}$, of the tendon with prestressing steel strands according to Annex 4 are listed in Annex 4.

#### 3.2.1.2 Resistance to fatigue

The PT system as described in the ETA meets the acceptance criteria of EAD 160004-00-0301, Clause 2.2.2. The characteristic values of maximum force, $F_{pk}$, of the tendon with prestressing steel strands according to Annex 4 are listed in Annex 4.

Fatigue resistance of anchorages was tested and verified with an upper force of $0.65 \cdot F_{pk}$, a fatigue stress range of $80 \text{ N/mm}^2$, and $2 \cdot 10^6$ load cycles.

#### 3.2.1.3 Load transfer to the structure

The PT system as described in the ETA meets the acceptance criteria of EAD 160004-00-0301, Clause 2.2.3. The characteristic values of maximum force, $F_{pk}$, of the tendon with prestressing steel strands according to Annex 4 are listed in Annex 4.

Conformity with the stabilisation and crack width criteria specified for the load transfer test was verified to a force level of $0.80 \cdot F_{pk}$.

#### 3.2.1.4 Friction coefficient

For friction losses including friction coefficient see Clause 1.6.

#### 3.2.1.5 Deviation, deflection (limits) for internal bonded and unbonded tendon

For minimum radii of curvature see Clause 1.8.

#### 3.2.1.6 Assessment of assembly

The PT system as described in the ETA meets the acceptance criteria of EAD 160004-00-0301, Clause 2.2.7.

#### 3.2.1.7 Corrosion protection

The PT system as described in the ETA meets the acceptance criteria of EAD 160004-00-0301, Clause 2.2.13.
3.2.2 Safety in case of fire

3.2.2.1 Reaction to fire

The performance of components made of steel or cast iron is Class A1 without testing. The performance of components of other materials has not been assessed.

3.2.3 Hygiene, health, and the environment

3.2.3.1 Content, emission and/or release of dangerous substances

According to the manufacturer’s declaration, the PT system does not contain dangerous substances.

- SVOC and VOC
  The performance of components made of steel or cast iron that are free of coating with organic material is no emission of SVOC and VOC.
  The performance of components of other materials has not been assessed.

- Leachable substances
  The product is not intended to be in direct contact to soil, ground water, and surface water.

3.3 Assessment methods

The assessment of the essential characteristics in Clause 3.1 of DYWIDAG single monostrand anchorage, for the intended use, and in relation to the requirements for mechanical resistance and stability, safety in case of fire, and for hygiene, health, and the environment, in the sense of the basic requirements for construction works № 1, 2, and 3 of Regulation (EU) № 305/2011, has been made in accordance with Annex A of EAD 160004-00-0301, Post-tensioning kits for prestressing of structures, for Item 2, Internal unbonded tendon.

3.4 Identification

The European Technical Assessment for DYWIDAG single monostrand anchorage is issued on the basis of agreed data that identify the assessed product. Changes to materials, to composition, or to characteristics of the product, or to the production process could result in these deposited data being incorrect. Österreichisches Institut für Bautechnik should be notified before the changes are introduced, as an amendment of the European Technical Assessment is possibly necessary.

4 Assessment and verification of constancy of performance (hereinafter AVCP) system applied, with reference to its legal base

4.1 System of assessment and verification of constancy of performance

According to Commission Decision 98/456/EC, the system of assessment and verification of constancy of performance to be applied to DYWIDAG single monostrand anchorage is System 1+. System 1+ is detailed in Commission Delegated Regulation (EU) № 568/2014 of 18 February 2014, Annex, point 1.1., and provides for the following items.

(a) The manufacturer shall carry out

(i) factory production control;

---

5 The technical file of the European Technical Assessment is deposited at Österreichisches Institut für Bautechnik.

OIB-205-118/17-019
(ii) further testing of samples taken at the manufacturing plant by the manufacturer in accordance with the prescribed test plan.  

(b) The notified product certification body shall decide on the issuing, restriction, suspension, or withdrawal of the certificate of constancy of performance of the construction product on the basis of the outcome of the following assessments and verifications carried out by that body:

(i) an assessment of the performance of the construction product carried out on the basis of testing (including sampling), calculation, tabulated values, or descriptive documentation of the product;

(ii) initial inspection of the manufacturing plant and of factory production control;

(iii) continuing surveillance, assessment, and evaluation of factory production control;

(iv) audit-testing of samples taken by the notified product certification body at the manufacturing plant or at the manufacturer's storage facilities.

4.2 AVCP for construction products for which a European Technical Assessment has been issued

Notified bodies undertaking tasks under System 1+ shall consider the European Technical Assessment issued for the construction product in question as the assessment of the performance of that product. Notified bodies shall therefore not undertake the tasks referred to in Clause 4.1, point (b) (i).

5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable EAD

5.1 Tasks for the manufacturer

5.1.1 Factory production control

The kit manufacturer exercises permanent internal control of the production. All the elements, procedures, and specifications adopted by the kit manufacturer are documented in a systematic manner in the form of written policies and procedures.

- Control of the incoming materials
  The manufacturer checks the incoming materials to establish conformity with their specifications.

- Inspection and testing
  Kind and frequency of inspections, tests, and checks, conducted during production and on the final product normally include:
  
  - Definition of the number of samples taken by the kit manufacturer
  - Material properties e.g. tensile strength, hardness, surface finish, chemical composition, etc.
  
  - Determination of the dimensions of components
  - Check correct assembly
  - Documentation of tests and test results

All tests are performed according to written procedures with suitable calibrated measuring devices. All results of inspections, tests, and checks are recorded in a consistent and systematic way. The basic elements of the prescribed test plan are given in Annex 7, conform to

---

6 The prescribed test plan has been deposited with Österreichisches Institut für Bautechnik and is handed over only to the notified product certification body involved in the procedure for the assessment and verification of constancy of performance. The prescribed test plan is also referred to as control plan.
EAD 160004-00-0301, Table 3, and are specified in the quality management plan of the DYWIDAG single monostrand anchorage.

The results of inspections, tests, and checks are evaluated for conformity. Shortcomings request the manufacturer to immediately implement measures to eliminate the defects.

- Control of non-conforming products
  
  Products, which are considered as not conforming to the prescribed test plan, are immediately marked and separated from such products that conform. Factory production control addresses control of non-conforming products.

- Complaints
  
  Factory production control includes procedures to keep records of all complaints about the PT system.

The records are presented to the notified product certification body involved in continuous surveillance and are kept at least for ten years after the product has been placed on the market. On request, the records are presented to Österreichisches Institut für Bautechnik.

At least once a year the manufacturer audits the manufacturers of the components given in Annex 8.

5.1.2 Declaration of performance

The manufacturer is responsible for preparing the declaration of performance. When all the criteria of the assessment and verification of constancy of performance are met, including the certificate of constancy of performance issued by the notified product certification body, the manufacturer draws up the declaration of performance. Essential characteristics included in the declaration of performance for the corresponding intended use are given in Table 4.

5.2 Tasks for the notified product certification body

5.2.1 Initial inspection of the manufacturing plant and of factory production control

The notified product certification body establishes that, in accordance with the prescribed test plan, the manufacturing plant, in particular personnel and equipment, and the factory production control are suitable to ensure a continuous manufacturing of the PT system according to the given technical specifications. For the most important activities, EAD 160004-00-0301, Table 4 summarises the minimum procedure.

5.2.2 Continuing surveillance, assessment, and evaluation of factory production control

The activities are conducted by the notified product certification body and include surveillance inspections. The kit manufacturer is inspected at least once a year. Factory production control is inspected and samples are taken for independent single tensile element tests.

For the most important activities, the control plan according to EAD 160004-00-0301, Table 4 summarises the minimum procedure. It is verified that the system of factory production control and the specified manufacturing process are maintained, taking account of the control plan.

Each manufacturer of the components given in Annex 8 is audited at least once in five years. It is verified that the system of factory production control and the specified manufacturing process are maintained, taking account of the prescribed test plan.

The results of continuous surveillance are made available on demand by the notified product certification body to Österreichisches Institut für Bautechnik. When the provisions of the European Technical Assessment and the prescribed test plan are no longer fulfilled, the certificate of constancy of performance is withdrawn by the notified product certification body.
5.2.3 Audit-testing of samples taken by the notified product certification body at the manufacturing plant or at the manufacturer's storage facilities

During surveillance inspection, the notified product certification body takes samples of components of the PT system for independent testing. Audit-testing is conducted at least once a year by the notified product certification body. For the most important components, Annex 8 summarises the minimum procedures. Annex 8 conforms to EAD 160004-00-0301, Table 4. In particular, at least once a year, the notified product certification body also carries out one single tensile element test series according to EAD 160004-00-0301, Annex C.7 and Clause 3.3.4 on specimens taken from the manufacturing plant or at the manufacturer’s storage facility.

</table>

1) Checking by means of an inspection report 3.1 according to EN 10204.
2) Conformity with the specifications of the component
3) Successful visual inspection does not need to be documented.
4) Checking of relevant certificate as long as the basis of "CE"-marking is not available.
5) Maximum between a coil and 7 tons is taken into account.

Traceability full: Full traceability of each component to its raw material.
Material Defined according to technical specification deposited by the supplier.
Detailed dimension Measuring of all dimensions and angles according to the specification given in the test plan.
Visual inspection Main dimensions, correct marking and labelling, surface, corrosion, coating, etc.
Treatment, hardness Surface hardness, core hardness, and treatment depth.

1) Testing of hardness and checking of chemical composition by means of an inspection report 3.1 according to EN 10204.

2) Conformity with the specifications of the component

- **Material**: Defined according to technical specification deposited by the ETA holder at the Notified body
- **Detailed dimension**: Measuring of all the dimensions and angles according to the specification given in the test plan
- **Visual inspection**: Main dimensions, correct marking and labelling, surface, corrosion, coating, etc.
- **Treatment, hardness**: Surface hardness, core hardness, and treatment depth
